## Audio Transformer LL1646

LL1646 is a general purpose, medium impedance audio transformer, with a variety of connection alternatives. The transformer is built up from two coils, each with a secondary winding surrounded by shields and two primary windings. This structure results in an excellent frequency response. All winding ends are available on the pins. Thus, the transformer can be used in many different applications, such as a medium or low impedance input transformer, or as an output transformer.

The LL1646 is made with amorphous core material. As this type of core does not store energy (unlike conventional mu-metal cores) the low frequency resonances with external capacitors is practically eliminated. Refer to the back side of this sheet for termination alternatives.
